

M-Base News No. 33, January 2007

New Version of Material Data Center

Our internet platform for Engineering Plastics has been **re-designed** and offers a complete new user interface. The presentation allows users an easy and direct access to the different modules of Material Data Center. Additionally, we have added completely new data contents and functionality to the system.

Here are the major **new features**:

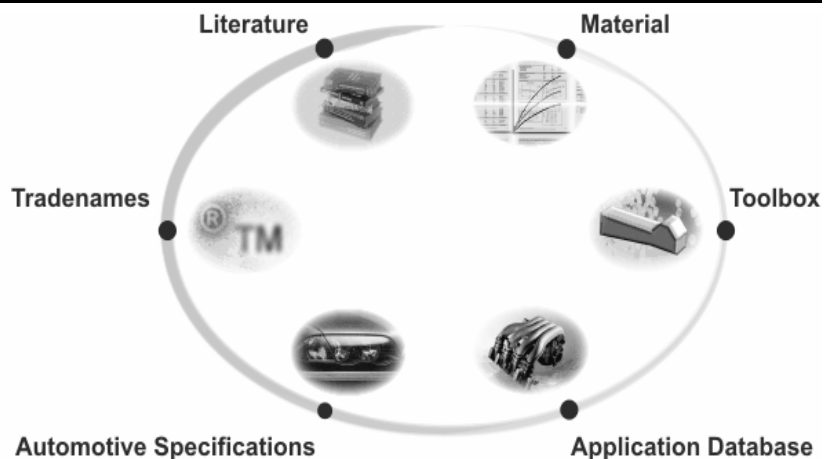

The item "**material**" offers two alternative ways to enter the system. The "Free Datasheet Lookup" offers datasheets of several thousand plastics, including the complete set of **CAMPUS®** data. These datasheets are available for all visitors, free of costs and without any registration.

Material Data Center is available at:
www.materialdatacenter.com
Access for one year: 350,- Euro

Registration for one week of demo access is available online.

The second option offers the complete functionality of the Material Data Center with the same set of data. An annual fee is charged for this service. It enables users to search for properties, compare materials, create tables, search for substitute materials, generate pdf datasheets and many more.

The **Toolbox** is now also available from the start screen, which makes it much

The new Interface of Material Data Center

easier to use our calculation programs for snap fit design, cooling time, flow-length and others. Also the well accepted Application Database is now available directly from the start menu.

Literature

With this new module we make the first step towards an integration of so called "soft data", like literature, reports, etc. into our factual databases with "hard" numerical data. In the first version, all registered users of Material Data Center get access to the complete content of the "**International Plastics Handbook**" by Osswald, Baur, Brinkmann, Schmachtenberg and Oberbach.

The system allows a full text search in the book and links to the relevant

pages. For a little extra fee it becomes possible to use the complete text as an "**e-book**", which means the table of contents can be used for navigation and the user can scroll through the pages without limitation.

Another very special new navigation tool was added to Material Data Center. A complete **text search** module allows to enter a search phrase and scan all available databases for this text phrase. The search includes all product texts from the material database, all application information, all literature and the tradename database. From the result list, the user can link directly to the relevant hits in the different systems.
